March is for Maple Syrup and Monkeyflower

Maple Syrup Time in Connecticut
The sap is running and sugar houses are boiling. The maple syrup industry is alive and well when the weather cooperates, providing warm days and cold nights to signal the sugar maple trees to make sap. Maple syrup makers will have to collect 40 gallons of sap to boil down to make one gallon of syrup. March is filled with opportunities to visit sugar houses and festivals around the state.

Maple Syrup Events in Connecticut

Plant Highlight

How Did the Monkeyflower Get Its Spots? Research is being done at UConn EEB on how and why this wonderful wildflower is able to diversify its spots. Stay tuned!

Monkeyflower
Insect Highlight

Fireflies overwinter in bark crevices and can sometimes be seen crawling on the sunny side of tree trunks on warm winter days.

---

Bears will be waking up when warm weather hits.

Black bears will be coming out of hibernation as the weather warms. Their populations have been growing and more bears means increased sightings and potential conflicts with humans. Reduce reasons for them to come into your yard by removing bird feeders and bring in garbage cans promptly.
Connecticut Conservation District plant and Seedling Sales

The Connecticut Conservation Districts are ready to take your orders for their annual plant and seedling sales. Each district will have some unique plants for their sale, such as bloodroot (shown above), pagoda dogwood, swamp milkweed, highbush blueberry, chokeberry and many others. There are five districts throughout our state so check out the ones near you for their sales brochures and ordering forms on the link below.

Connecticut Conservation Districts

We hope the UConn Home & Garden Education Center has helped you with your gardening queries and quandaries, next month we will be
asking for your help through UConn Gives. More information in April's e-update.

Gardening Tips for March

- Seeds of annuals that require 10-12 weeks of growth before transplanting can be started indoors now.
- Pot up begonia and caladium bulbs. Place in a warm, bright location to encourage growth.
- Prune any houseplants that have gotten leggy to encourage new growth.
- Seeds of vegetables, such as tomatoes, peppers, eggplants, and herbs that require 10-12 weeks of growth before transplanting can be started indoors no.
- Check for tan gypsy moth egg masses on tree trunks and branches. Scrape or brush off and destroy if possible.
- Get your soil tested through the UConn Soil Nutrient Analysis Laboratory before any major planting or fertilizing venture. Soils sent in before April 1 will avoid the spring rush.
For a more extensive list of tips visit Gardening Tips for March

Have Your Soil Tested for Macro- & Micro Nutrients

Send your soil sample in for testing now. For details on submitting a sample, go to UConn Soil and Nutrient Laboratory.

UConn Extension Home & Garden Education Center

The UConn Home & Garden Education Center (HGEC) is a horticultural informational resource for the citizens of Connecticut and beyond. The staff at the Center reach nearly 400,000 citizens in outreach efforts each year. We’re ready to assist you.

You are receiving this email because you have provided us with your email address either when having your soil analyzed or testing the horticultural prowess and investigative abilities of our incredibly well-versed staff at the UConn Home & Garden Education Center! If you do not wish to receive our monthly email updates on gardening tips, pest problems, events and other information, please email us at ladybug@uconn.edu and ask to be removed from this list.

We Need Your Support!

If you enjoy our efforts to keep you informed about horticultural and UConn-related items, please show your support by liking us on Facebook, following us on Pinterest or Instagram, checking out our weekly Ladybug blog, or visiting the Home & Garden Education Center website.
